

**MULTI-MEDIA COMMUNICATION MANAGEMENT SYSTEM  
WITH ENHANCED VIDEO CONFERENCE SERVICES**

**Abstract**

5 The multi-media communication management system comprises a control unit that interfaces with a plurality of communication space stations and with one or more communication medium service providers. The control unit provides video conference services to the communication space stations. To provide video conference services, the control unit receives an indication of a plurality of conference session participants. The controller identifies a participating subscriber station that is serving a subscriber device associated with each conference session participant. A conference mix module establishes a streaming media communication channel with each participating subscriber station for receiving an audio signal from the participating subscriber station and for sending a mixed audio signal to the participating subscriber station.
